Welcome to NAIRJC

ISSN NO: 2454 -7514

North Asian International Research Journal of Science, Engineering & Information Technology is a research journal, published monthly in English, Hindi. All research papers submitted to the journal will be double-blind peer reviewed referred by members of the editorial board. Readers will include investigator in Universities, Research Institutes Government and Industry with research interest in the general subjects

SECOND QUANTIZATION OF ELECTROMAGNETIC FIELD IN TERMS OF STRENGTHS \vec{E} AND \vec{H}

DR. BULIKUNZIRA SYLVESTRE*

*University of Rwanda, University Avenue, B.P117, Butare, Rwanda

ABSTRACT

In the previous work, the Lagrange formalism for electromagnetic field in terms of strengths \vec{E} and \vec{H} has been elaborated. First, invariant Lagrange function for electromagnetic field has been written through electric and magnetic vectors \vec{E} and \vec{H} , and then, using Noether's theorem, expressions for dynamical variables (energy, momentum, charge and spin) conserved in time have been written through vectors \vec{E} and \vec{H} .

In this work, in development of the above ideas, we elaborated the second quantization of electromagnetic field in terms of vectors \vec{E} and \vec{H} .

Keywords: *Second quantization, electromagnetic field, strengths.*

INTRODUCTION

In previous works, Maxwell's equations for electromagnetic field have been written in different forms. In particular, they have been written through complex vector $\vec{F} = \vec{E} + i\vec{H}$. Furthermore, the Lagrange formalism for electromagnetic field in terms of complex isotropic vector $\vec{F} = \vec{E} + i\vec{H}$ has been elaborated.

In this work, in development of the above ideas, we shall elaborate the second quantization of electromagnetic field in terms of strengths \vec{E} and \vec{H} .

RESEARCH METHOD

In the previous work, the Lagrange formalism for electromagnetic field in terms of strengths \vec{E} and \vec{H} has been elaborated. Invariant Lagrange function for electromagnetic field in terms of strengths \vec{E} and \vec{H} has been written.

Furthermore, using Noether's theorem, expressions for dynamical variables (energy, momentum, charge and spin) conserved in time have been obtained in terms of strengths \vec{E} and \vec{H} .

In this work, we shall develop the second quantization of electromagnetic field in terms of strengths \vec{E} and \vec{H} . Here, we shall find expressions for dynamical variables (energy, momentum, charge and spin) conserved in time in terms of the number of particles.

Second Quantization of Electromagnetic Field in Terms of Strengths \vec{E} and \vec{H}

Let us introduce complex vector

$$\vec{F} = \vec{E} + i\vec{H}, \tag{1}$$

where \vec{E}, \vec{H} are electric and magnetic field strengths. Then, Maxwell's equations for vacuum

$$\begin{cases} \vec{\nabla} \times \vec{E} + \frac{\partial \vec{H}}{\partial t} = 0 \\ \vec{\nabla} \times \vec{H} - \frac{\partial \vec{E}}{\partial t} = 0 \\ \vec{\nabla} \cdot \vec{E} = 0 \\ \vec{\nabla} \cdot \vec{H} = 0 \end{cases} \tag{2}$$

can be written in the form

$$\begin{cases} D^0 \vec{F} = i\vec{D} \times \vec{F} \\ \vec{D} \vec{F} = 0 \end{cases} \tag{3}$$

Here

$$D^0 = \frac{i}{2} \frac{\partial}{\partial t} \tag{4}$$

$$\vec{D} = -\frac{i}{2} \vec{\nabla} \tag{5}$$

The solution of equations (3) can be written in the form

$$\vec{F} = \vec{F}^0 e^{-2ikt + 2i\vec{k}\vec{r}}, \tag{6}$$

Where

$$\vec{F}^0 = \frac{i}{2} \begin{bmatrix} \sin \varphi + i s \cos \vartheta \cos \varphi \\ -\cos \varphi + i s \cos \vartheta \sin \varphi \\ -i s \sin \vartheta \end{bmatrix}, \quad (7)$$

$k = |\vec{k}|$ is the energy, $s = \pm 1$ is the polarization and φ, ϑ are the angles of orientation of the wave vector \vec{k} , chosen so that $k_1 + ik_2 = k \sin \vartheta e^{i\varphi}$, $k_3 = k \cos \vartheta$.

Separating real and imaginary parts in formula (7), we obtain the solution for field strengths

$$\vec{E} = \frac{1}{2} \begin{bmatrix} \sin \varphi \\ -\cos \varphi \\ 0 \end{bmatrix} e^{-2ikt + 2i\vec{k}\vec{r}} \quad (8)$$

$$\vec{H} = \frac{1}{2} \begin{bmatrix} s \cos \vartheta \cos \varphi \\ s \cos \vartheta \sin \varphi \\ -s \sin \vartheta \end{bmatrix} e^{-2ikt + 2i\vec{k}\vec{r}} \quad (9)$$

In previous work, it has been proved that Maxwell's equations (3) can be obtained from the Lagrange function

$$L = \frac{i}{2} \{ [D^0 \vec{F} - i\vec{D} \times \vec{F}] \vec{F}^* - [D^0 \vec{F}^* + i\vec{D} \times \vec{F}^*] \vec{F} \} / \left(\frac{\vec{F}\vec{F}^*}{2} \right)^{1/2}. \quad (10)$$

In terms of strengths \vec{E} and \vec{H} , formula (10) can be written in the form

$$L = \frac{i}{4|\vec{E}|} \left\{ \left[\vec{E} \frac{\partial \vec{H}}{\partial t} - \vec{H} \frac{\partial \vec{E}}{\partial t} + \vec{E} \cdot \vec{\nabla} \times \vec{E} + \vec{H} \cdot \vec{\nabla} \times \vec{H} \right] + i \left[\vec{E} \frac{\partial \vec{E}}{\partial t} + \vec{H} \frac{\partial \vec{H}}{\partial t} - \vec{E} \cdot \vec{\nabla} \times \vec{H} + \vec{H} \cdot \vec{\nabla} \times \vec{E} \right] \right\}. \quad (11)$$

Using Noether's theorem, from the Lagrange function (11), we find the following expressions for dynamical variables (energy, momentum, charge and spin) conserved in time.

For energy we find

$$E = \int T^{00} d^3x, \quad (12)$$

Where

$$T^{00} = \frac{1}{4|\vec{E}|} \left[-\vec{H} \frac{\partial \vec{E}}{\partial t} + i\vec{E} \frac{\partial \vec{E}}{\partial t} + \vec{E} \frac{\partial \vec{H}}{\partial t} + i\vec{H} \frac{\partial \vec{H}}{\partial t} \right]. \quad (13)$$

Considering the solution in the form of plane waves

$$\vec{E} = \vec{E}^0 e^{-2ikt+2i\vec{k}\vec{r}}, \quad (14)$$

$$\vec{H} = \vec{H}^0 e^{-2ikt+2i\vec{k}\vec{r}}, \quad (15)$$

we obtain

$$T^{00} = k|\vec{E}|. \quad (16)$$

Similarly for momentum, we have

$$P^j = \int T^{0j} d^3x, \quad (17)$$

Where

$$T^{0j} = \frac{1}{4|\vec{E}|} \left[-\vec{H} \frac{\partial \vec{E}}{\partial x_j} + i\vec{E} \frac{\partial \vec{E}}{\partial x_j} + \vec{E} \frac{\partial \vec{H}}{\partial x_j} + i\vec{H} \frac{\partial \vec{H}}{\partial x_j} \right]. \quad (18)$$

With the relations (14)-(15), we obtain

$$T^{0j} = k_j |\vec{E}|. \quad (19)$$

For charge, we find

$$Q = \int j^0 d^3x, \quad (20)$$

Where

$$j^0 = -\frac{i}{|\vec{E}|} (i\vec{E}\vec{E} + i\vec{H}\vec{H}), \quad (21)$$

Or

$$j^0 = |\vec{E}|. \quad (22)$$

In the same way, for the spin pseudo vector we find

$$\vec{s} = \frac{\vec{E} \times \vec{H}}{|\vec{E}|}. \quad (23)$$

Let us expand the wave function $\vec{E}(x)$ and $\vec{H}(x)$ in Fourier series

$$\vec{E}(x) = \sum_{k,s} a_s(\vec{k}) \vec{E}_s(\vec{k}) e^{-2ikt + 2i\vec{k}\vec{r}}, \quad (24)$$

$$\vec{E}^*(x) = \sum_{k,s} a_s^*(\vec{k}) \vec{E}_s^*(\vec{k}) e^{2ikt - 2i\vec{k}\vec{r}}. \quad (25)$$

$$\vec{H}(x) = \sum_{k,s} a_s(\vec{k}) \vec{H}_s(\vec{k}) e^{-2ikt + 2i\vec{k}\vec{r}}, \quad (26)$$

$$\vec{H}^*(x) = \sum_{k,s} a_s^*(\vec{k}) \vec{H}_s^*(\vec{k}) e^{2ikt - 2i\vec{k}\vec{r}}. \quad (27)$$

Replacing formulas (24)- (19) in formulas (12), (17), (20) and (23) and considering the normalization condition

$$\int \left[\frac{\vec{E}_{ks}^* \vec{E}_{k's'}}{2|\vec{E}|} + \frac{\vec{H}_{ks}^* \vec{H}_{k's'}}{2|\vec{E}|} \right] d^3x = \delta_{kk'} \delta_{ss'}, \quad (28)$$

we obtain

$$E = \sum_{k,s} k [a_s^*(\vec{k}) a_s(\vec{k})], \quad (29)$$

$$P_j = \sum_{k,s} k_j [a_s^*(\vec{k}) a_s(\vec{k})], \quad (30)$$

$$Q = \sum_{k,s} [a_s^*(\vec{k}) a_s(\vec{k})], \quad (31)$$

$$S_j = \sum_{k,s} \alpha_j [a_s^*(\vec{k}) a_s(\vec{k})]. \quad (32)$$

Here \vec{e} is a unit vector in the direction of the polarization vector \vec{S} .

Changing $a_s(\vec{k})$ into operator $\hat{a}_s(\vec{k})$, we find the following operators for physical quantities

$$\hat{E} = \sum_{k,s} k [\hat{a}_s^+(\vec{k}) \hat{a}_s(\vec{k})], \quad (33)$$

$$\hat{P}_j = \sum_{k,s} k_j [\hat{a}_s^+(\vec{k}) \hat{a}_s(\vec{k})], \quad (34)$$

$$\hat{Q} = \sum_{k,s} [\hat{a}_s^+(\vec{k}) \hat{a}_s(\vec{k})], \quad (35)$$

$$\hat{S}_j = \sum_{k,s} \alpha_j [\hat{a}_s^+(\vec{k}) \hat{a}_s(\vec{k})]. \quad (36)$$

To ensure the positive determination of energy, we must require the following commutation relations

$$[\hat{a}_s^+(\vec{k}), \hat{a}_{s'}(\vec{k}')]_- = \delta_{kk'} \delta_{ss'}. \quad (37)$$

Using formulas (33)-(36), we find expressions for eigenvalues of the above operators

$$E = \sum_{k,s} k [N_{ks}], \quad (38)$$

$$P_j = \sum_{k,s} k_j [N_{ks}], \quad (39)$$

$$Q = \sum_{k,s} [N_{ks}], \quad (40)$$

$$S_j = \sum_{k,s} \alpha_j [N_{ks}]. \quad (41)$$

Here N_{ks} is the number of particles.

DISCUSSION AND CONCLUSION

In previous works, Maxwell's equations for electromagnetic field have been written through complex isotropic vectors $\vec{F} = \vec{E} + i\vec{H}$ and the Lagrange formalism for electromagnetic field in terms of complex isotropic vectors $\vec{F} = \vec{E} + i\vec{H}$ has been elaborated. Furthermore, the second quantization of electromagnetic field in terms of complex isotropic vectors $\vec{F} = \vec{E} + i\vec{H}$ has been developed. In this work, we went further and we elaborated the second quantization of electromagnetic field in terms of strengths \vec{E} and \vec{H} . Here, dynamical variables (energy, momentum, charge and spin) conserved in time have been expressed through the number of particles.
